

Write the Git command for each.

- Initialize a repository: `git init`
- Stage all files: `git add .`
- Commit with a message: `git commit -m "Initial commit"`
- Push to remote: `git push origin main`
- Pull latest changes: `git pull origin main`

What is the difference between `git fetch` and `git pull`? (2 lines)

- `git fetch` downloads the latest changes from the remote repository but does not merge them into your local branch.
- `git pull` downloads the latest changes and automatically merges them into your current local branch.

Create a new GitHub repository, push any small text file from your local system, and share the repo link.

I can't create a GitHub repository or upload files on your behalf.

After creating the repository and pushing your file, share the repository link in this format:

Example: `https://github.com/your-username/my-first-repo`

(Replace `your-username` and `my-first-repo` with your actual GitHub username and repository name.)

What is the difference between a Fork and a Pull Request? (2 lines)

- A **Fork** is a personal copy of someone else's GitHub repository in your own GitHub account.
- A **Pull Request** is a request to merge your changes from a branch or fork into the original repository.

Create a new branch named `feature-test`, make one commit on it, and merge it back to the `main` branch. Write the commands you used.

```
git checkout -b feature-test
echo "This is a test file." > test.txt
git add test.txt
git commit -m "Added test file"
git checkout main
git merge feature-test
git push origin main
```
